

The first project management tool to unify field and office workers.

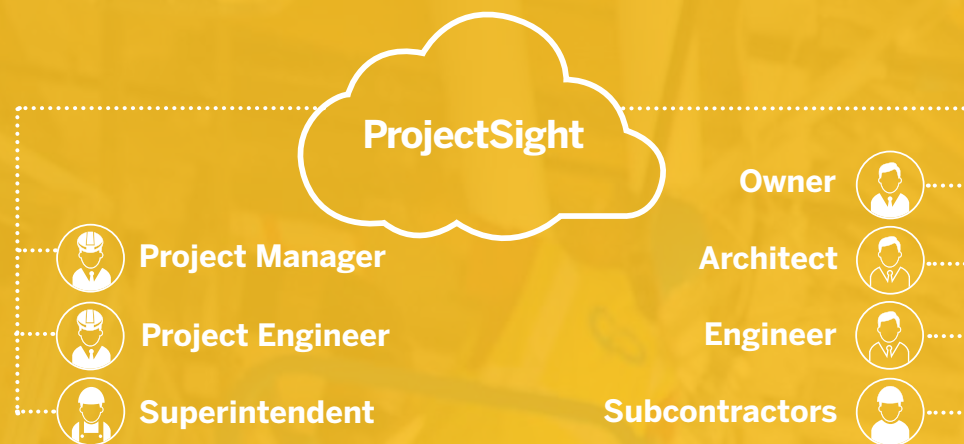

- Shared system to eliminate data silos
- Single source for access and update of project data
- Mark-up plans right from the field
- Online and offline access, always

Trimble ProjectSight™ Project Management Solution

Streamline Your Decision Making Process and Regain Control of Projects

Introducing ProjectSight™

ProjectSight Transforms the Way You Work by Organizing the Chaos

When it comes to project management, control is everything. We've talked to project managers across a broad spectrum of construction projects – from housing to healthcare, mid-sized to massive. Despite their many differences, nearly all project managers report a common challenge: loss of visibility and lack of control over design and documentation versions.

How can you control what you can't see? Over the last decade, the building construction industry has encouraged the rapid influx of lightweight point tools dedicated to simplifying a single task. What we now face is a proliferation

of information silos that impede project managers' visibility and understanding of day-to-day project status.

Trimble created ProjectSight specifically to address the challenges you face when making difficult jobsite decisions. This first-of-its-kind project management tool empowers stakeholders to access and share their most relevant information. Marrying both 2D and BIM-based designs, ProjectSight creates a single-source of project data. RFIs, issues, submittals and work orders are all captured, managed and tracked in one easy-to-use system.

Break Down the Silo Walls

ProjectSight streamlines productivity by integrating information from a wide variety of sources. No more searching through multiple systems to find the drawings or work orders you need to give an answer fast. As your digital drawing cabinet, ProjectSight ensures that all stakeholders are working from the same – most up-to-date information – whether you're in the field or in the office.

ProjectSight™

Collaborate Through Team Conversations

ProjectSight streamlines the decision making processes. Now team members can collaborate and converse on issues rather than filling out forms. Team Conversations appear alongside drawings and models for easy reference. When a question arises, relevant parties are notified for comment. Team Conversations are the new way to collaborate — combining the simplicity of text messaging and the traceability of a fully-fledged project management solution.

Team members comment on questions as they arise. Project managers can make quick decisions and inform relevant parties.

Real Project Control. Right in the Field.

With 25+ years of experience in project controls, we know what teams in the field need to organize information and get results fast. ProjectSight offers support for access controls, security features and configuration options that competitive solutions don't.

Trimble ProjectSight encourages real collaboration between stakeholders enabling you to make and share informed decisions fast and from anywhere. Team Conversations bring a level of transparency to the process by allowing relevant parties to have insight into why decisions were made.

ProjectSight promotes smart workflows and tight collaboration, regardless of whether team members are in the office or the field. And it's fully functional on multiple digital devices.

No matter whether you're working in 2D or 3D, ProjectSight enables you to mark up, annotate and link files directly on the design.

Collaboration in Context

"Context" is one of the biggest challenges with most project management tools. Receiving feedback or a comment is no problem. But what does it mean? What's it referring to?

ProjectSight addresses this by allowing contributors to comment directly on the official project documentation without creating unnecessary clutter. It allows for mark-up of both 2D drawings and 3D BIM files. A full screen viewer with high-performance graphics automatically reads Title Block and organizes them by type. Annotations can be linked to any asset, putting data in context

Working with Models

Powered by Trimble Connect, ProjectSight enables you to interact with BIM directly within the app. Bringing together architectural, structural, mechanical, electrical and plumbing on one screen in a complete constructible model, you'll be able to identify and solve potential issues before they're full-scale problems. With Trimble Connect as the engine for model sharing, all approved stakeholders can access the models without pricey design software.

A Solution That's Easy to Use

ProjectSight puts a wealth of information right in the palm of your hand. Our secure software solutions integrate with a wide array of drawing and BIM solutions. And, it's intuitive to use with minimal training required – in-app videos and on-screen guidance are available when questions arise so you don't waste time hunting for the features you need. When decisions need to be made and time is of the essence, ProjectSight is the only tool you need.
